Announcement

The Network considers it of academic interest to focus its attention on specific methodological theme and issues for the dual purpose of updating latest debates and articulating directions for future enquiry. This will take the form of publishing in the Methodus essays and notes revolving around a particular theme in the form of a symposium.

Following our last Symposium on Political Economy, we believe this sort of symposia will do much to promote interaction between economists and scientists in other disciplines.

Symposium on Economics and Biology

The forthcoming issue of Methodus (Vol.5. No.1) to appear in June, 1993 will feature, among other papers, a symposium on Economics and Biology.

In his article “Economics and Biology: Eight Areas of Research” appearing in this issue, Elias L. Khalil organizes the contemporary economic literature relating to biology and identifies eight problem areas. While it may not be exhaustive, this article provides a general map on what has been done and what are the issues. We hope that it will stimulate thoughts and generate discussions on the whole topic as well as separate areas. Members are invited to submit articles, notes and comments etc. on this topic no later than April 15, 1993. Submissions should preferably not exceed 30 double-spaced typed pages.
